

Data-Binding Keys Comparison

SearchYourProperty vs AppraisalToolReact

This compares the **object/field keys used to bind property data to the UI** in each project (not environment variables). The two projects have completely different data models.

SearchYourProperty: clean, camelCase JSON keys (its own mock schema), bound from `src/data/properties/*.json` via `src/api.js` into components (`data.accountNumber`, `data.buildings`, etc.)

AppraisalToolReact: raw Aumentum/GIS feature-attribute keys (PascalCase / legacy DB column names, e.g. `OBJECTID`, `BldgID`, `TotalBldgArea25`), fetched live from ArcGIS + SQL Server and bound almost 1:1 into tables/forms (`useParcel.js`, `useBuilding.js`, `useOwnerData.js`).

None of AppraisalToolReact's binding keys are used in SearchYourProperty, and vice versa — they don't share a single key name.

Parcel / Land

Concept	SearchYourProperty key	AppraisalToolReact key
Parcel / account identifier	<code>accountNumber</code> , <code>stateParcelNumber</code>	<code>OBJECTID</code> , <code>PID</code> , <code>taxPIN</code>
Parent parcel link	<code>(flat model, n/a)</code>	<code>ParentObjectID</code>
Lasso / grouping id	<code>(n/a)</code>	<code>LassoID</code>
Land area	<code>landSegments[].acres</code>	<code>LandArea14</code> , <code>LandArea25</code>
Land value/tax class code	<code>landSegments[].abstractCode</code>	<code>Tax14ValueCode</code> , <code>Tax25ValueCode25</code>
Land value multiplier/adjustment	<code>landAttributes[].attributeAdjustment</code>	<code>Improvement_Adj_Amt25</code>
Appraisal status	<code>(n/a)</code>	<code>Appraisal_Status</code> , <code>Appraisal_Exclusion_Status</code>
Notes	<code>(n/a)</code>	<code>Notes</code> , <code>GRMNotes</code>
Neighborhood	<code>neighborhoods[].code</code>	<code>Neighborhood</code>
Zoning	<code>zoningCode</code> , <code>zoningCodeDescription</code>	<code>Zone</code>
Sale date	<code>sales[].date</code>	<code>Sale_Date</code> , <code>S25_SellDate</code>
Sale price	<code>sales[].price</code>	<code>Sale_Indicated_Price</code> , <code>S25_Price</code>
Valid sale flag	<code>sales[].isValid1</code>	<code>IsValidForRatio</code>

Building

Concept	SearchYourProperty key	AppraisalToolReact key
Building identifier	<code>buildings[].buildingNumber</code>	<code>BldgID</code>
Building type	<code>buildings[].propertyType</code>	<code>Improvement_Type</code>
Construction type	<code>buildings[].styles[].exteriorConstructionType</code>	<code>Construction_Type</code>

Concept	SearchYourProperty key	AppraisalToolReact key
Building classification	buildings[].uses[].useCodeDescription	Improvement_Classification
Total building area	buildings[].squareFeet	TotalBldgArea14, TotalBldgArea25
Bedroom count	buildings[].styles[].bedroomCount	NOT PRESENT ANYWHERE
Bathroom count	buildings[].styles[].bathroomCount	NOT PRESENT ANYWHERE
Room count	buildings[].styles[].numberOfRooms	NOT PRESENT ANYWHERE
Building condition	buildings[].conditionType	Buildingcondition
Effective age	buildings[].styles[].effectiveAge	Effective_Age25, Effective_Age
Separate tax id	(n/a)	Taxed_Separate_ID
Tax status	(n/a)	Bldg_Tax_Status
Building rate	(computed via valuesByAbstractCode)	BldgRate25
Depreciation	(n/a)	Depreciation25
Replacement cost new	(n/a)	RCN (= BldgRate25 x TotalBldgArea25)
Depreciated value	(n/a)	DV (= RCN - Depreciation25)
Special purpose flag	(n/a)	Special_Purpose
Economic life	(n/a)	EconomicLife25

Owner / Value

Concept	SearchYourProperty key	AppraisalToolReact key
Owner name	owners[].name	(Legal Party name, /data/owners-details)
Owner effective date	(n/a)	Legal_Party_Effective_Date
Last updated timestamp	(n/a)	LAST_UPDATE
Mailing address	owners[].mailingAddress.{street,city,state,zipCode}	(owner-property-details fields)
Assessed value (by year)	valuesByAbstractCode[].assessedValue	(returned per-call from calculate*Value)
Mill levy	taxAuthorities[].funds[].millLevy	(tax-authority table field, not in hooks reviewed)

Full Key Inventory (all 148 keys, exhaustively checked)

Every unique key in SearchYourProperty's JSON data model was checked against every .js/.jsx file in AppraisalToolReact (frontend + backend, excluding node_modules). Only **5 of 148** exist as an exact, literal key name anywhere in AppraisalToolReact — and even those are coincidental (different shape/meaning), not true shared data models.

Genuine exact-name matches (5):

Key	Where it appears	Same concept?
buildings	subTables.jsx (local form array)	Different shape - not the same model
taxYear	PublicBillView.jsx (bill payment param)	Same concept, unrelated feature
latitude	MapView.jsx (event.mapPoint.latitude)	Live map-click point, not stored field
longitude	MapView.jsx (event.mapPoint.longitude)	Same as above
effectiveAge	useBuilding.js, backend/valueRoutes.js	Real overlap - same concept & name

Everything else — 143 keys — is not used anywhere in AppraisalToolReact, grouped by area:

Account / Parcel core: accountNo, accountNumber, accountType, appraisalType, stateParcelNumber, legalDescription, taxDistrictNumber, zoningCode, zoningCodeDescription, defaultLea, defaultLeaDescription, totalImprovementInterestPercent, totalLandInterestPercent, isVacant, isImprovementOnly, isTif, isPlatted, numberOfBuildings, isPrivate, ppAccount, quartersection, section, township, range, elevation, neighborhoods

Owner / Address: owners, mailingAddress, addresses, street, street2, city, state, zipCode, isPrimary

Subdivision: subdivision, filingNumber, recordingNumber

Sales: sales, grantor, grantee, date, price, deedType, book, page, isValid1, isImproved

Tax authorities / Levies: taxAuthorities, pointOfContact, contactPhone, funds, millLevy, alternateMillLevy

Assessed values (by year): valuesByAbstractCode, abstractCode, abstractCodeDescription, netAcres, actualValue, assessedValue, taxDollars, assessmentRate, alternateAssessedValue, alternateTaxDollars, alternateAssessedRate

Buildings / structure: buildingNumber, propertyType, completedPercent, quality, perimeter, squareFeet, netSquareFeet, unitType, approachType, conditionType, details, type, subtype, unitCount, builtYear, addonCode, addonCodeDescription, uses, useCode, useCodeDescription, usePercentage, styles, styleCode, styleCodeDescription, bedroomCount, bathroomCount, numberOfRooms, exteriorConstructionType, floorMaterialType, heatType, hvacPercent, interiorFinishType, numberOfStories, remodeledPercent, remodeledYear, roofConstructionType, roofMaterialType, sprinklerCoverageSquareFeet, totalUnitCount, typicalStoryHeight, length, width, height, mobileHomeMake, mobileHomeModelType, mobileHomeSkirt, mobileHomeSkirtLinearFeet, mobileHomeWallType

Land: landAttributes, attributeType, attributeTypeDescription, attributeAdjustment, landSegments, acres

Building permit authority: buildingPermitAuthority, phone, email, url

Notices / Appeals: notifications, note, novTaxYears, appeals, appealNo, decision, reason

Documents: directories, files, downloadUrl, lastModified, sizeWithUnits, sizeInBytes, fileExtension, extension, code, id, name, description

Note: a handful of common English words (name, id, type, date, code, state, city, email, phone, url, note, range, section, street, details, sales, styles, notifications, uses) do appear somewhere in AppraisalToolReact's source, but only as generic variable names, UI library imports (Mantine styles/Notifications), comments, or unrelated text (e.g. "Sales Data" heading, "New Subdivision" chip label) — not as the same bound data-model key. Those are excluded from the 5 genuine matches above.

Why they don't overlap

- SearchYourProperty's JSON is a hand-designed demo schema built for readability (camelCase, nested by concept: owners, sales, buildings, landSegments).
- AppraisalToolReact binds straight to Aumentum/ArcGIS feature attributes and SQL columns (OBJECTID, BldgID, TotalBldgArea25, ...), so its keys are whatever the underlying GIS/DB schema calls them — not renamed for the UI.

- If SearchYourProperty is ever wired to the same backend, the components would need to map these Aumentum-style keys onto (or replace) the current clean data.* shape.
- AppraisalToolReact doesn't track residential-style attributes like bedroom/bathroom/room counts at all — it's an assessor/GIS valuation tool (land + improvement value, tax, sales ratio), not a property-listing style app, so those fields simply don't exist in its data model or database columns.
